NFCTEC
Tap. Connect. Secure.

COMPANY PROFILE

NFC and secure technology, engineered as one stack.

From the RF field and the smart card, through security, identity and crypto wallets, to the software, hardware and cloud that ship the product.

NFCTEC
Tap. Connect. Secure.

One engineering company for the card, the reader and the service behind them.

NFCTEC works across NFC and RF, smart cards, and security and identity. Crypto wallets are part of that work: keys, signing and cold storage live with the same cards, secure elements and readers.

Three foundations

NFC and RF, smart cards, and security and identity, including crypto wallets.

Three ways to deliver

Software, hardware and cloud. A project can move from a module to an SDK and an API.

Prototype to production

Requirements, firmware, security, wallets and testing stay on one path.

NFCTEC
Tap. Connect. Secure.

The stack the work actually touches.

Field

01

NFC & RF

Protocols, antennas, reader controllers and the firmware that lets a reader talk to a card.

ISO/IEC 14443 · ISO/IEC 15693 · NFC Forum · NDEF · PN5180 · ST25R3916

Card

02

Smart cards

Card operating systems, APDU exchange, personalization and issuance.

Java Card · GlobalPlatform · SCP02 · SCP03 · EMV · DESFire · FeliCa

Keys

03

Security, identity, wallets

Keys, secure elements, FIDO2, digital identity, and crypto wallets on card or secure element.

FIDO2 · HSM · SE050 · ePassport · secp256k1 · BIP-39

NFCTEC
Tap. Connect. Secure.

Software, hardware and cloud.

SOFTWARE

SDKs and tools

Reader SDK for Windows, Linux and Android. Smart Card SDK for Java Card, GlobalPlatform and PC/SC. Desktop tools to prepare and check personalization data.

APDU NDEF USB PC/SC

HARDWARE

Readers and modules

Desk and embedded NFC readers on USB, serial and CCID. Modules and antennas for hosts such as ESP32 and STM32, over UART, SPI or I2C.

PN5180 PN7150 ST25R3916

CLOUD

Issuance and verification

Credential APIs for issuance, verification and status. Keys stay with the key-management service, not in the browser.

REST HTTPS HSM

NFCTEC
Tap. Connect. Secure.

Practical project areas.

01
Payment
Card applications, EMV APDUs, personalization and issuance.

02
Identity
ePassport, PIV and FIDO2. Keys stay on the card, element or HSM.

03
Access control
DESFire, MIFARE, FeliCa readers, and OSDP to the controller.

04
Brand protection
NTAG 424 DNA, SUN messages and server-side verification.

05
Transit
Fare media, validator readers, and issuance behind an API.

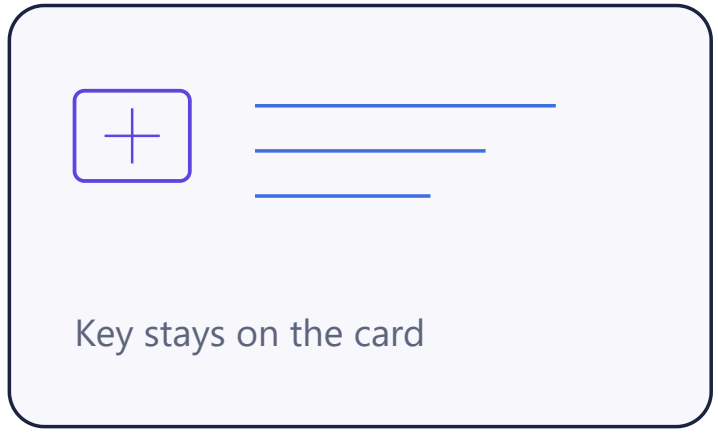

06
IoT
NFC commissioning, with device identity held in a secure element.

CRYPTO WALLETS

Wallets are part of the card and secure-element work.

Hardware wallets, cold-storage cards and on-card signing sit in the same engineering stack as NFC, smart cards and key storage. The card or secure element holds the key. Signing happens on the card.

secp256k1 · ed25519 · BIP-32 · BIP-39 · Hardware wallet · Cold storage card · On-card signing

On-card signing

NFCTEC
Tap. Connect. Secure.

Prototype to production.

01
Requirements
Protocol, chip, card, reader, wallet or cloud constraint.

02
Architecture
How RF, card, keys and services connect.

03
Prototype
Media, reader or tap, proven in the lab.

04
Firmware / SDK
Host interface, APDU, NDEF, diagnostics.

05
Security
Secure channel, element, identity, wallet keys.

06
Cloud
Issuance, verification and status.

07
Testing
Against the target card, reader and encoding.

08
Production
Personalization, issuance and later firmware.

NEXT STEP

Talk with an engineer about the stack you need to build.

Describe the protocol, card, reader, wallet or cloud piece. A project starts with a separate written agreement.
